

The Freedom Tech Security Stack

Real protection comes from layers that work together, and people watching around the clock.

Identity

Multi-factor authentication everywhere, 1Password for business credentials, Microsoft 365 identity monitoring and dark-web monitoring for stolen passwords.

Endpoint

Endpoint detection and response on every computer and server, automated patching, and device management with encryption and remote wipe.

24/7 monitoring

Our in-house security operations center watches for threats around the clock and responds to isolate and stop attacks.

Email

Advanced filtering for phishing, malicious links and attachments, impersonation protection, and SPF, DKIM and DMARC for your domain.

Network

Managed business-grade firewalls, DNS filtering that protects users anywhere, network segmentation and secure remote access.

Data

Backups for servers and Microsoft 365, with isolated copies out of ransomware's reach and regular test restores.

People

Security awareness training and simulated phishing, because most attacks start with a person, not a computer.

Visibility & response

Centralized security-event correlation (SIEM), incident response planning and regular security reviews for higher-risk organizations.

Which plan includes what

Layer	Essential	Complete	Secure
Patching, monitoring, endpoint & email protection, identity & dark-web monitoring, phishing training	✓	✓	✓
Advanced EDR with 24/7 managed detection & response		✓	✓
1Password, Microsoft 365 & Entra ID backup		✓	✓
Enhanced controls, managed SIEM/SOC, security reviews			✓
